

Technical Information

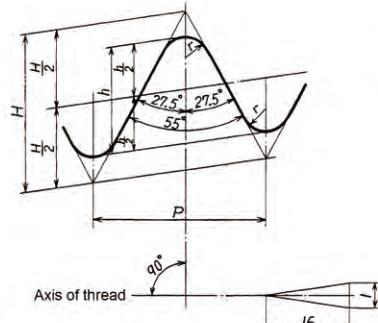

Taper Pipe Thread JIS B 0203:1999* (BSPT)

Extracted and partly modified from JIS B 0203:1999. For further information, please refer to JSA, Japanese Standards Association, <https://www.jsa.or.jp/en/>

Inspection The threads manufactured in accordance with this Annex shall, as a rule, be inspected with limit gauge for taper screw thread specified in annex (normative) to JIS B 0253.

Attached Table 1 Basic Thread Profile, Basic Dimensions and Tolerances

Basic profile applied for taper external and taper internal threads

Thick solid line shows the basic thread profile

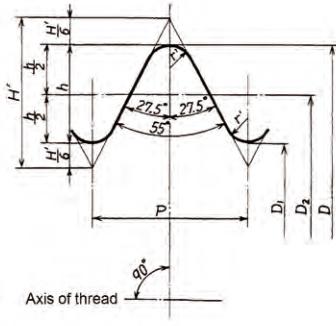

$$P = \frac{25.4}{n}$$

$$H = 0.960\ 237\ P$$

$$h = 0.640\ 327\ P$$

$$r = 0.137\ 278\ P$$

Basic profile applied for parallel internal threads

Thick solid line shows the basic thread profile

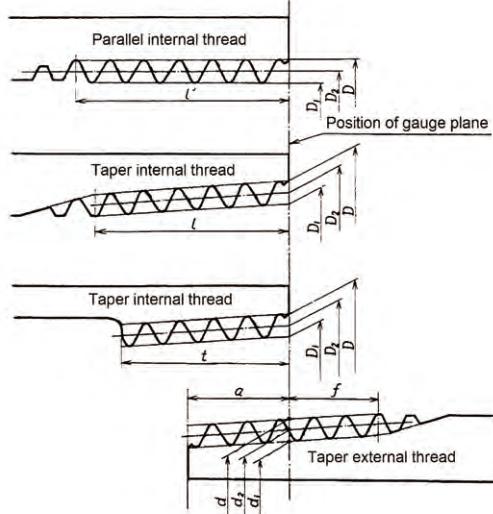

$$P = \frac{25.4}{n}$$

$$H' = 0.960\ 491\ P$$

$$h = 0.640\ 327\ P$$

$$r' = 0.137\ 329\ P$$

Fitting between taper external thread and taper internal or parallel internal thread

Attached Table 1 Basic Thread Profile, Basic Dimensions and Tolerances (concluded)

(Unit: mm)

Designation of thread size ⁽³⁾	Thread				Gauge diameter			Position of gauge plane		Tolerance on D , D_2 and D_1 of parallel internal thread	Length of useful thread (min.)				Size of carbon steel pipe for ordinary piping (Reference)				
	Number of threads (in 25.4mm)	Pitch (informative)	Height of thread	Radius	External thread			External thread	Internal thread		External thread	Internal thread		Outside diameter	Thickness				
					Major dia.	Pitch dia.	Minor dia.					When there is incomplete thread part	When there is no incomplete thread part						
					d	d_2	d_1					Taper internal thread	Parallel internal thread	Taper internal thread, parallel internal thread					
	Internal thread				Gauge length	Axial tolerance	Axial tolerance	From position of gauge plane to larger diameter end	From position of gauge plane to smaller diameter end		f	ℓ	ℓ'	ℓ					
	Major dia.											From end of pipe or coupler

Notes ⁽³⁾: This designation is for taper external threads, and for taper internal threads and parallel internal threads, the notation R shall be substituted by Rc or Rp.

(4): In case of the taper thread, length from position of gauge plane to smaller diameter end, and in case of parallel internal thread, length from the end of pipe or coupler.

Remarks 1: The thread shall be perpendicular to the axis, and the pitch shall be measured in parallel with the axis.

2: The length of useful thread is the length of completely screwed part, except the last several threads which may be truncated at the crest by its intersection with the cylindrical surface of the pipe or coupler. The chamfered end of the pipe or coupler, is included in the length of useful thread part.

Technical Information

Making the Best Threads

How you cut steel pipes has a great influence on the shape of a thread

1) Use the most appropriate cutting tool for the type of pipe used.

Depending on your intended use, refer to the following for cutting steel pipes used for construction equipment.

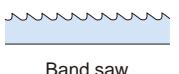

Type	Blade	Appropriate REX Products	Steel Pipe	Stainless Steel Pipe
Band saw cutting machine	 Band saw	Mantis 125/120A/180WS/180WA/270A	OK	OK
Circular saw cutting machine	 Circular saw	Carbide cutter TC-20 -150	OK	X
Pipe cutter	 Cutter wheel	Cutter on pipe machine (standard equipment)	OK	OK*

Table 1. Types of Cutter and their use

* Optional cutter wheel

2) Cutting precision has a great influence on the shape of the thread.

Only use pipes with a flat, right-angled cut. Avoid using pipes with a slant or step of more than 1 mm. (Fig. 1)

- When a thread is cut on a steel pipe that has been correctly cut at right angles, the 4 dies work in unison to cut a perfect thread. (Fig. 2)
- When a thread is cut on a steel pipe where the end of the pipe is slanted or has steps, the result is a polygonal thread or a pipe of uneven thickness. (Fig. 3)

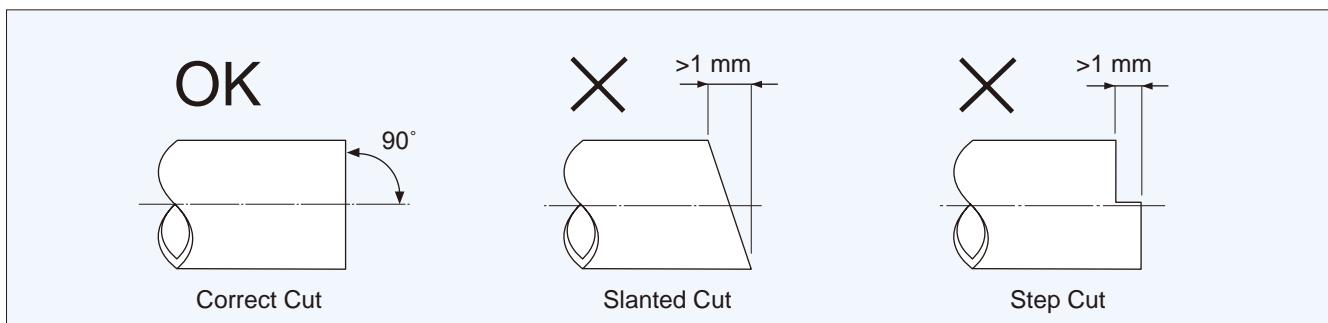

Fig. 1 Acceptable and unacceptable pipe ends

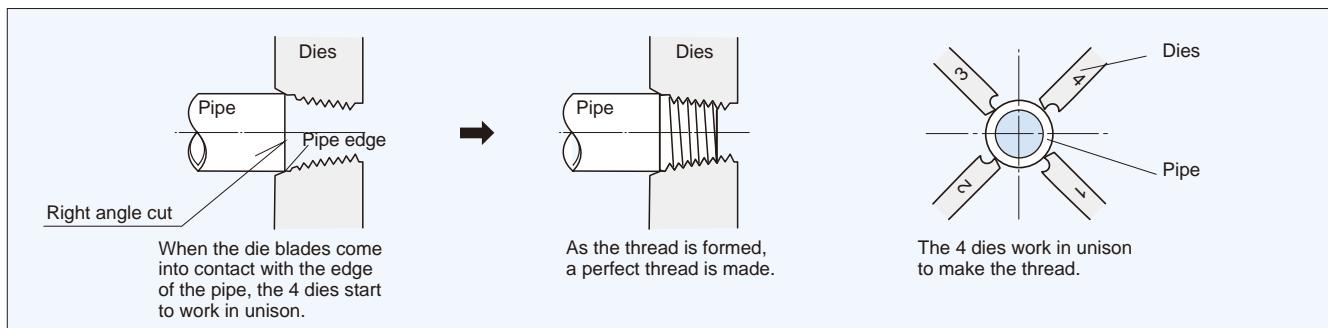

Fig. 2 Principle of cutting threads with a set of dies

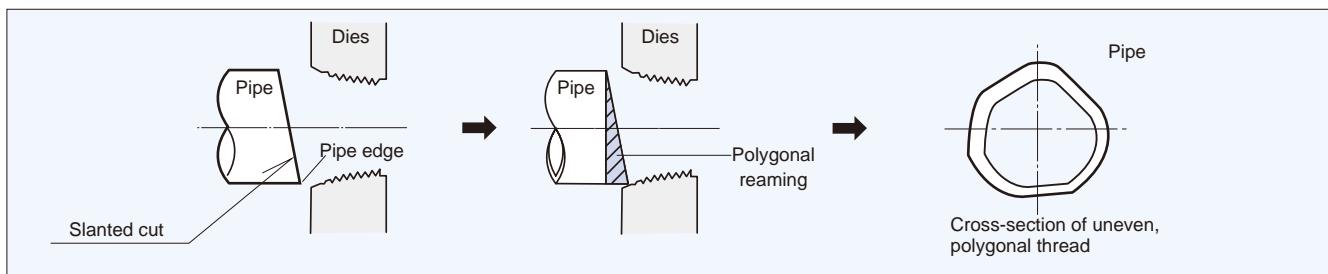

Fig. 3 Principle of polygonal threads

Using the right oil means consistent finishes and increases the life of the dies

1) Cutting oil comes in 3 types: for use with tap water pipes, general plumbing, and stainless steel pipes.

As shown in the table below, use the correct cutting oil according to the type of pipe. (Table 2)

Note: Using cutting oil for stainless steel on steel pipes will result in imperfect threads and leakages.

Cutting oil	Type of pipe	Steel pipes for tap water	Stainless steel pipes	General plumbing pipes
For tap water pipes 50W-R, N50W	OK	X	OK	
For general plumbing 246-R, N246	X	X	OK	
For stainless steel pipes 100SW-RN	X	OK		X

Table 2. Appropriate cutting oil

2) Changing cutting oil, and causes of a reduction in oil performance

If any of the following occurs, it means it is time to change the cutting oil.

contains water

contains 10% iron powder

contains 20% iron powder

Problem	Cause
If the oil becomes cloudy	This is the result of water getting mixed into the oil. If the cutting oil contains more than 20% water, the life of the dies will be drastically reduced.
If the oil turns black	When the amount of oil flowing from the die head is reduced, the surfaces where the pipe is cut get very hot and smoke is produced. This greatly reduces the performance of the oil.
If the oil becomes 'shiny' caused by metal powder	This means that microscopic colloidal sediment or metal powder has become mixed in with the oil. Change the oil.

3) Amount of cutting oil

The oil coming from the Die-head should flow continuously without interruption, and no smoke should be produced.

Inspecting the Thread

After making a thread, inspect it both visually and with a thread gauge to ensure it is accurate.

Inspection with a tapered thread ring gauge

ISO 7/1 (JIS B0203) Male Tapered Thread for Pipe

a: standard distance from pipe edge

b, b': allowance from pipe edge along the axis

f: Necessary effective thread portion (minimum)

Thread is acceptable if the pipe edge is located between b and b' after you screw the pipe thread into the ring gauge with your hand.

When the male thread is screwed into the taper thread ring gauge by hand, if the end face of the male thread is between the notches -b and +b as shown in Figure 5, it is passed, and if it is out of place, it is rejected.

To pass, the full thread length (L) must have three or more threads from the large diameter end face of the gauge, and if the thread length is less than three threads, it is too short and fails.

Gauge: see page 33.
